

In my opinion, **what makes humans human** is the ability to **think** at a deeper level than any other animal species in the world that we know of, **so far**.

Dr. Victor Jean Ouellette, DC, MS
May 2011- May 2013

That does not mean we think better than every other creature that may exist in the universe. It only means that we think better than any other creature **we have discovered so far**. And that actually means the data that is in the common public media.

Tandem to the thinking ability, we can also say about our species, “That we can **use that thinking process** to manipulate our physical surroundings better than any other creature we have discovered so far.”

This concept is the important part.

‘better than any other creature we have discovered so far’

**Humans both think and manipulate things, in our space,
better than any other creature we have discovered so far.**

Dr. Victor Jean Ouellette, DC, MS

Creatures that think in the energy world though, ?

I guess we are still waiting on that.

Maybe human thought (or all thought), is actually within the energy world?

If thoughts are information, and thoughts are things, and information cannot be lost, then maybe a thought has some form of weight or momentum much like a Photon. Maybe we should call it a **Thoton**? AND, maybe all those Thotons are stored somewhere? Previous writings discuss this concept. (If Thotons are twisted filaments of momentum that are anchored somewhere (somewhere possibly not in this 3-4 dimensional world), then that twist would produce Potential energy.) That compilation of all thoughts ever thought would then have quite an effect on astrophysics, wouldn't it? Just saying, and this would also have an effect on the anchor location.
