

By intertwined we mean connected in some hidden way inside the human head and not easy to see or understand.

Is it possible all three stem from how developed an in-depth human thinking process has 'grown-up', inside a human head from childhood? The ability to sort out something that is observed, but the cause is hidden, is where the human brain flourishes and triumphs among other animals that lack that thinking capability. Remember, thinking is what makes humans human.

To see something, not knowing it's cause, then claim it is magic, is not how the human deep-thinking process works. Rather, it is how the animal thinking brain works that just accepts magic as real. Like your pet cat or pet dog, when they see something they don't understand, they just accept it as real and go on with their stimulus-response lifestyle. Humans can do that too. Those who follow their animal brain behave like that. They might just be lazy, they might just be uneducated, they might have a hidden ulterior motive like making money, they might be weak, immature, afraid and so, just follow the crowd, **OR** they may just need a coping skill. To be a fully thinking human, one needs to reject all four cardinal animal behaviours explained in other articles. This brings up the question "Can young children be brainwashed much like dictators brainwash their populations using repeated media and rituals?" Won't this brainwashing then slow, or stop completely, any in-depth human thinking? Coping skills are necessary. We understand that. However, it is not our place to delve into child rearing.

Is it possible that the entire fields of mysticism, spiritualism, psychic phenomenon, cultural superstitions, religions (let's lump them all into the field of **MAGIC**), are just an excuse to **not** learn and think deeply? Are these all just attributed to human laziness? Thinking lazily is a very common human problem which is pandemic in scope worldwide.

How then are these three major topics, in the title of this article, linked together inside our heads?
